

*O species, stunned by your terror of chill death, why  
fear the Styx, why fear the ghosts and empty names, the  
stuff of poets, the spectres of a phantom world? [...] ]  
Everything changes, nothing dies: the spirit wanders,  
arriving here or there, and occupying whatever body it  
pleases, passing from a wild beast into a human being,  
from our body into a beast, but is never destroyed. As  
pliable wax, stamped with new designs, is no longer what  
it was; does not keep the same form; but is still one and  
the same.*

*(Ovid, Metamorphoses, book XV: 143-175)*

# Evolutionary paleoecology and the biology of extinction

Peter D Smits

Committee on Evolutionary Biology, University of Chicago

March 31, 2014

Theory

Survival

Communities

Summary

Theory

Survival

Communities

Summary

# Extinction

*All species that have ever lived are, to a first approximation, dead.*

*(Raup 1986 The Nemesis Affair)*

# Foundation

## Question

Why do certain taxa go extinct while others do not?

# Evolutionary paleoecology

*... the consequences of distinct ecological factors on differential rate dynamics, particularly rates of faunal turnover and diversification.*

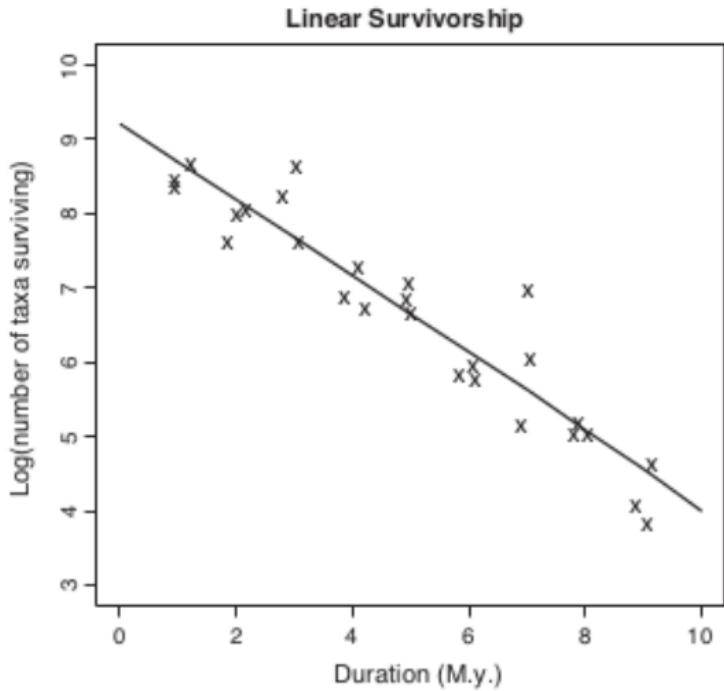

(Kitchell 1985 *Paleobiology*)

## In context of this study

Rephrased

How does a taxon's adaptive zone affect extinction risk?

# Van Valen's observation

(Liow et al. 2011 *TREE*)

# Law of Constant Extinction

## Definition

Extinction rate, in a given adaptive zone, is taxon–age independent.

(Van Valen 1973 *Evol. Theory*)

# Approach

## Framework and setup

- ▶ background extinction
- ▶ traits related to environmental preference
  - ▶ “bound” adaptive zone
- ▶ when/which/what processes dominate:  
global, regional, local

# Systems

## brachiopods

- ▶ marine
- ▶ sessile
- ▶ Permian ( $\sim 47$  My)
- ▶ global warming
- ▶ Australia

## mammals

- ▶ terrestrial
- ▶ motile
- ▶ Cenozoic ( $\sim 65$  My)
- ▶ global cooling
- ▶ North America, Europe, South America

# Proposed studies

- ▶ Australian Permian brachiopods
  - ▶ survival patterns
  - ▶ community connectedness (not shown)
  - ▶ traits: substrate, habitat, affixing strategy
- ▶ Cenozoic mammals
  - ▶ survival patterns (not shown; come to Evolution2014)
  - ▶ community connectedness
  - ▶ traits: dietary and locomotor categories, body size

Theory

Survival

Communities

Summary

# Probability of survival

Theoretical  $S(t)$ :

## Survival function

$$S(t) = P(T > t)$$

- ▶  $T$ : survival time  $\geq 0$  (duration)
- ▶  $t$ : specified time

$\hat{S}(t)$  in practice:

(Kleinbaum and Klein 2012)

# Instantaneous potential of failure (extinction)

Hazard function  $\equiv$  conditional failure rate

$$h(t) = \lim_{\Delta t \rightarrow 0} \frac{P(t \leq T < t + \Delta t | T \geq t)}{\Delta t}$$

# Formalization of Van Valen

## Law of Constant Extinction

Hazard is constant with respect to time (**exponential survival**).

$$h(t) = \lambda \iff S(t) = \exp^{-\lambda t}$$

# Brachiopods, environmental preference, and extinction

## Questions

- ▶ Do traits related to environmental preference have different distributions of taxonomic duration?
  - ▶ Is survival best modeled by a single trait or multiple?
  - ▶ How do other factors, such as climate, affect these patterns?
- ▶ Is extinction taxon-age independent or dependent?

# Substrate affinity

(Miller and Connolly 2001 *Paleobio.*)

(Foote 2006 *Paleobio.*)

- ▶ depositional setting
  - ▶ carbonates, clastics
  - ▶ availability
- ▶ Phanerozoic decrease carbonates:clastics
  - ▶ predicted longevity: clastics > carbonates

# Habitat preference

(Jablonski *et al.* 1983 *Science*)

- ▶ storm wave base
  - ▶ on-shore, off-shore, none
  - ▶ availability
  - ▶ stability
- ▶ offshore > onshore

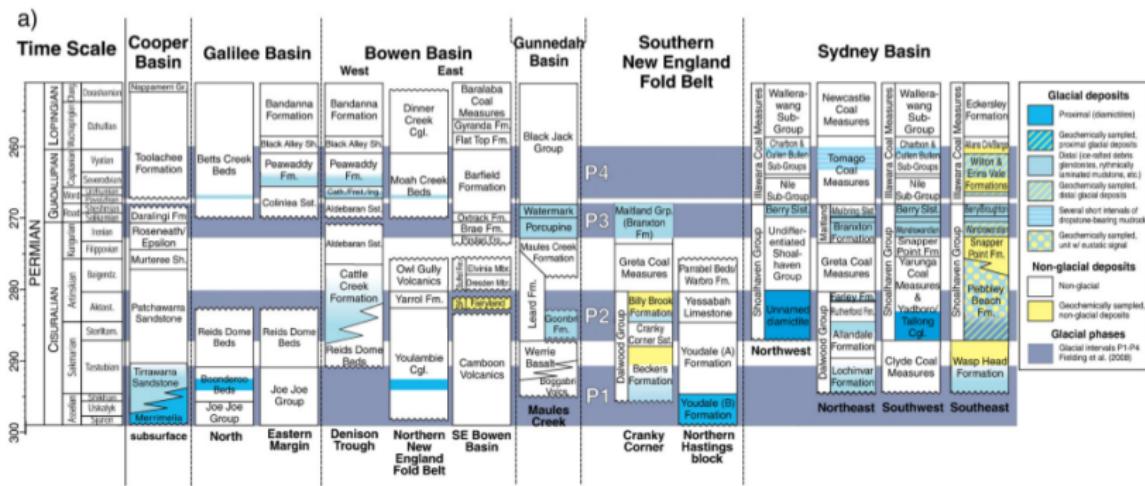

# Affixing strategy

- ▶ energetics, material (mud)
- ▶ pedunculate, reclining, cementing
  - ▶ endemics:  
reclining > others
  - ▶ cosmopolitan:  
ped./cement > others
- ▶ pedunculate:on-shore,  
reclining:off-shore

(Johansen 1989 *Paleo*<sup>3</sup>)

# Permian climate

(Birgenheier *et al.* 2010 *Paleo*<sup>3</sup>)

# Assigning substrate and habitat

## Probability of assignment

$$P(H_1|E) = \frac{P(E|H_1)P(H_1)}{P(E|H_1)P(H_1) + P(E|H_2)P(H_2)}$$
$$P(E|H) = \binom{n}{k} p^k (1-p)^{n-k}$$

- ▶  $p$ : proportion of all collections (e.g.) carbonate
- ▶  $n$ : total # taxon occurrences
- ▶  $k$ : of  $n$ , # (e.g.) carbonate occurrences

(Simpson and Harnik 2009 *Paleobiology*)

# Analysis

- ▶ genus FAD–LAD
- ▶ time-independent traits
  - ▶ preliminary substrate following Foote 2006 *Paleobio*.
  - ▶ preliminary habitat following Kiessling *et al.* 2007 *Paleo*<sup>3</sup>
- ▶ time-dependent climate

## Preliminary results: model comparison

# K-M curve habitat

# Estimated survival curve habitat

Theory

Survival

Communities

Summary

# Community connectedness

## Definition

The degree to which localities are composed of endemic versus cosmopolitan taxa, and how similar this ratio is across localities.

# Biogeographic networks

(Vilhena *et al.* 2013 *Sci. Reports*)

# Average relative number of endemics

$$u = \{1, 2, 1\}$$

$$n = \{6, 5, 6\}$$

$$L = 3$$

$$E \approx 0.24$$

$$E = \frac{\sum_{i=1}^L \frac{u_i}{n_i}}{L}$$

- ▶  $L$ : number of localities
- ▶  $u$ : number of taxa unique to a locality
- ▶  $n$ : number of taxa at a locality
- ▶  $0 \leq E \leq 1$

## Average relative occupancy per taxon

$$I = \{1, 2, 3, 1, 1, 2, 3, 3, 1\}$$

$$L = 3$$

$$N = 9$$

$$Occ \approx 0.63$$

$$Occ = \frac{\sum_{i=1}^N \frac{l_i}{L}}{N}$$

- ▶  $N$ : total number of taxa
- ▶  $l_i$ : number of localities a taxon occurs at
- ▶  $L$ : number of localities
- ▶  $0 \leq Occ \leq 1$

# Biogeographic connectedness

$$BC = \frac{O - N}{LN - N}$$

- ▶  $O$ : number of occurrences
- ▶  $N$ : total number of taxa
- ▶  $L$ : number of localities
- ▶  $0 \leq BC \leq 1$

# Global versus regional versus local scale

- ▶ global
  - ▶ corr w/ global climate
  - ▶ multiple regions corr
- ▶ regional
  - ▶  $\downarrow E, \uparrow Occ,$   
 $\uparrow BC, \uparrow code$
- ▶ local
  - ▶  $\uparrow E, \downarrow Occ,$   
 $\downarrow BC, \downarrow code$
- ▶ not mutually exclusive

(Sidor et al. 2013 PNAS)

# Community connectedness in Cenozoic mammals

## Questions

- ▶ How does the ratio of cosmopolitan to endemic taxa, per locality, change over time?
  - ▶ Is this pattern different between taxa exhibiting different traits?
  - ▶ How does this pattern vary in relation to phylogenetic similarity?
- ▶ When would we expect global, regional, and/or local processes to most strongly shape taxonomic patterns?

# Global expectations: locomotor category

(Strömberg et al. 2013 *Nature Com.*)

- ▶ arboreal
  - ▶  $\uparrow E$ ,  $\uparrow$  code
  - ▶  $\downarrow BC$ ,  $\downarrow$  Occ
- ▶ ground dwelling
  - ▶  $\downarrow E$ ,  $\downarrow$  code
  - ▶  $\uparrow BC$ ,  $\uparrow$  Occ
- ▶ scansorial
  - ▶ constant/random

# Global expectations: dietary category

- ▶ herbivore
  - ▶ most like combined
- ▶ carnivore
  - ▶ constant √ corr w/ herbivores
- ▶ omnivore
  - ▶ constant √ random

(Jernvall and Fortelius 2004 *Am. Nat.*)

# Preliminary results: NA, Eur

# Preliminary results: locomotor category NA

# preliminary results: locomotor category Eur

# Preliminary results: dietary category NA

# Preliminary results: dietary category Eur

Summary

# Fundamental

## Question

Why do some taxa go extinct while others do not?

# Evolutionary paleoecological rephrasing

## Question

How does a taxon's adaptive zone affect extinction risk?

# “Testing” the Law of Constant Extinction

Liow et al. 2011 *TREE*

Only applies during periods of relatively **constant** environment.

Measure, analyze, model changing environmental context.

Ask the following . . .

Is there a **general pattern** of extinction?

**What** traits matter for extinction and **when**?

**How** do they matter?
